

Correction of final exam n°1

Exercise 1 (5 points)

$$1. \frac{u_{n+1}}{u_n} = \frac{10^{n+1}}{(n+1)4^{2n+3}} \times \frac{n4^{2n+1}}{10^n} = \frac{10}{16} \times \frac{n}{n+1} \xrightarrow{n \rightarrow +\infty} \frac{10}{16} = \frac{5}{8}.$$

As $\frac{5}{8} < 1$, $\sum u_n$ converges via D'Alembert's test (ratio test).

$$2. \sqrt[n]{v_n} = \frac{n^{1/n}}{\ln(n)} = \frac{e^{1/n \ln(n)}}{\ln(n)} \xrightarrow{n \rightarrow +\infty} 0.$$

As $0 < 1$, $\sum v_n$ converges via Cauchy's test (root test).

Exercise 2 (4 points)

After developing with respect to the second column, we directly get that

$$P_A(X) = (2 - X)((1 - X)^2 - 4) = (2 - X)(X - 3)(X + 1)$$

Thus P_A is split over \mathbb{R} and $\text{Sp}_{\mathbb{R}}(A) = \{2, 3, -1\}$ with $m(2) = m(3) = m(-1) = 1$, therefore A is diagonalizable.

$$E_2 = \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \begin{cases} -x + 2z = 0 \\ 2x - z = 0 \end{cases} \right\}$$

$$= \text{Span} \left\{ \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} \right\}$$

$$E_3 = \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \begin{cases} -2x + 2z = 0 \\ -y = 0 \\ 2x - 2z = 0 \end{cases} \right\}$$

$$= \text{Span} \left\{ \begin{pmatrix} 1 \\ 0 \\ 1 \end{pmatrix} \right\}$$

$$E_{-1} = \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \begin{cases} 2x + 2z = 0 \\ 3y = 0 \end{cases} \right\}$$

$$= \text{Span} \left\{ \begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix} \right\}$$

$$\text{Thus } D = P^{-1}AP \text{ with } D = \begin{pmatrix} 2 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & -1 \end{pmatrix} \text{ and } P = \begin{pmatrix} 0 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & -1 \end{pmatrix}.$$

Via the transformations $C_1 \leftarrow C_1 + C_2$ then $L_2 \leftarrow L_2 - L_1$, we find that $P_B(X) = -(2 - X)^2(X + 4)$.

Thus P_B is split over \mathbb{R} and $\text{Sp}_{\mathbb{R}}(B) = \{2, -4\}$ with $m(2) = 2$ and $m(-4) = 1$.

$m(-4) = 1$ thus $\dim(E_{-4}) = 1$.

$$\begin{aligned} E_2 &= \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \begin{cases} x - y + z = 0 \\ 7x - 7y + z = 0 \\ 6x - 6y = 0 \end{cases} \right\} \\ &= \text{Vect} \left\{ \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix} \right\} \end{aligned}$$

$\dim(E_2) = 1 \neq 2 = m(2)$ thus B is not diagonalizable.

Exercise 3 (3,5 points)

1. Via the transformations $C_1 \leftarrow C_1 + C_2$ then $L_2 \leftarrow L_2 - L_1$, we get $P_A(X) = (1 - X)(2 - X)(a - X)$.
2. • If $a \notin \{1, 2\}$, then A admits 3 distinct eigenvalues, thus A is diagonalizable.
• If $a = 1$, then $P_A(X) = (1 - X)^2(2 - X)$. Thus P_A is split over \mathbb{R} and $\text{Sp}_{\mathbb{R}}(A) = \{1, 2\}$ with $m(1) = 2$ and $m(2) = 1$.

Thus A is diagonalizable iff $\dim(E_1) = 2$.

$$\begin{aligned} E_1 &= \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \begin{cases} z = 0 \\ -x + y + z = 0 \\ x - y = 0 \end{cases} \right\} \\ &= \text{Span} \left\{ \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix} \right\} \end{aligned}$$

Thus $\dim(E_1) = 1 \neq 2$, therefore A is not diagonalizable.

- if $a = 2$, then $P_A(X) = (1 - X)(2 - X)^2$. Thus P_A is split over \mathbb{R} and $\text{Sp}_{\mathbb{R}}(A) = \{1, 2\}$ with $m(1) = 1$ and $m(2) = 2$.

Thus A is diagonalisable iff $\dim(E_2) = 2$.

$$\begin{aligned} E_2 &= \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } -x + z = 0 \right\} \\ &= \text{Span} \left\{ \begin{pmatrix} 1 \\ 0 \\ 1 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} \right\} \end{aligned}$$

thus $\dim(E_2) = 2$, therefore A is diagonalizable.

Exercise 4 (3,5 points)

1. $A = \begin{pmatrix} 1 & 8 \\ 1 & 3 \end{pmatrix}$
2. $P_A(X) = (X + 1)(X - 5)$ thus the characteristic polynomial of A is split over \mathbb{R} , $\text{Sp}_{\mathbb{R}}(A) = \{-1, 5\}$ with $m(-1) = m(5) = 1$, therefore A is diagonalizable.

$$\text{Then : } E_{-1} = \text{Span} \left\{ \begin{pmatrix} -4 \\ 1 \end{pmatrix} \right\} \text{ and } E_5 = \text{Span} \left\{ \begin{pmatrix} 2 \\ 1 \end{pmatrix} \right\}.$$

$$\text{Thus } D = P^{-1}AP \text{ with } D = \begin{pmatrix} -1 & 0 \\ 0 & 5 \end{pmatrix} \text{ and } P = \begin{pmatrix} -4 & 2 \\ 1 & 1 \end{pmatrix}.$$

3. Thus, $X'(t) = PDP^{-1}X(t)$. By setting $Y(t) = P^{-1}X(t)$ we get that

$$P^{-1}X'(t) = DP^{-1}X(t)$$

, that is to say $Y'(t) = DY(t)$.

So, with $Y(t) = \begin{pmatrix} y_1(t) \\ y_2(t) \end{pmatrix}$, we get $y_1'(t) = -y_1(t)$ and $y_2'(t) = 5y_2(t)$

thus $y_1(t) = C_1e^{-t}$ and $y_2(t) = C_2e^{5t}$ where $(C_1, C_2) \in \mathbb{R}^2$.

Therefore : $X(t) = PY(t) = \begin{pmatrix} -4C_1e^{-t} + 2C_2e^{5t} \\ C_1e^{-t} + C_2e^{5t} \end{pmatrix}$

Thus $x(t) = -4C_1e^{-t} + 2C_2e^{5t}$ and $y(t) = C_1e^{-t} + C_2e^{5t}$.

Exercise 5 (3 points)

$$1. f(E_{11}) = \begin{pmatrix} -1 & 2 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} = \begin{pmatrix} -1 & 0 \\ 1 & 0 \end{pmatrix} = -E_{11} + E_{21}$$

$$f(E_{12}) = \begin{pmatrix} -1 & 2 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} = \begin{pmatrix} 0 & -1 \\ 0 & 1 \end{pmatrix} = -E_{12} + E_{22}$$

$$f(E_{21}) = \begin{pmatrix} -1 & 2 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} = \begin{pmatrix} 2 & 0 \\ 0 & 0 \end{pmatrix} = 2E_{11}$$

$$f(E_{22}) = \begin{pmatrix} -1 & 2 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 0 & 2 \\ 0 & 0 \end{pmatrix} = 2E_{12}$$

$$\text{Thus } \text{Mat}_{\mathcal{B}}(f) = \begin{pmatrix} -1 & 0 & 2 & 0 \\ 0 & -1 & 0 & 2 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{pmatrix}.$$

$$2. \Delta(E_{11}) = X^2; \Delta(E_{12}) = X; \Delta(E_{21}) = X - 1 \text{ and } \Delta(E_{22}) = X^2 + 1.$$

Hence, the matrix of Δ with respect to the standard bases is $\begin{pmatrix} 0 & 0 & -1 & 1 \\ 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{pmatrix}$.

Let us denote $\Delta =$

$$\begin{vmatrix} a_1 & a_1 & a_1 & \dots & \dots & a_1 \\ a_1 & a_2 & a_2 & \dots & \dots & a_2 \\ a_1 & a_2 & a_3 & \dots & \dots & a_3 \\ \vdots & \vdots & \vdots & \ddots & & \vdots \\ \vdots & \vdots & \vdots & & \ddots & \vdots \\ a_1 & a_2 & a_3 & \dots & \dots & a_n \end{vmatrix}.$$

$$\Delta = \begin{vmatrix} a_1 & a_1 & a_1 & \dots & \dots & a_1 \\ 0 & a_2 - a_1 & a_2 - a_1 & \dots & \dots & a_2 - a_1 \\ 0 & 0 & a_3 - a_2 & \dots & \dots & a_3 - a_2 \\ \vdots & \vdots & \ddots & \ddots & & \vdots \\ \vdots & \vdots & & \ddots & \ddots & \vdots \\ 0 & 0 & \dots & \dots & 0 & a_n - a_{n-1} \end{vmatrix}$$

$$L_n \leftarrow L_n - L_{n-1}$$

$$\vdots$$

$$L_2 \leftarrow L_2 - L_1$$

$$= a_1(a_2 - a_1)\dots(a_n - a_{n-1})$$
