Correction of final exam 1

Exercise 1 (5 points)

1. Let
$$(u_n) = \left(\frac{(n!)^2}{(3n)!}\right)$$
.

$$\frac{u_{n+1}}{u_n} = \frac{\left((n+1)!\right)^2}{(3n+3)!} \times \frac{(3n)!}{(n!)^2} = \frac{(n+1)^2}{(3n+1)(3n+2)(3n+3)} = \frac{n+1}{3(3n+1)(3n+2)} \xrightarrow[n \to +\infty]{} 0 < 1.$$

So $\sum u_n$ is convergent according to the d'Alembert's rule.

2. Let
$$(v_n) = \left(\frac{(n!)^2}{(kn)!}\right)$$
.

$$\frac{v_{n+1}}{v_n} = \frac{\left((n+1)!\right)^2}{\left(k(n+1)\right)!} \times \frac{(kn)!}{(n!)^2} = \frac{(n+1)^2}{(kn+1)(kn+2)\dots(kn+k)} \underset{+\infty}{\sim} \frac{1}{k^k} n^{2-k}.$$

If
$$k=2$$
, $\frac{v_{n+1}}{v_n} \xrightarrow[n \to +\infty]{} \frac{1}{4} < 1$ so $\sum v_n$ converges according to the d'Alembert's rule.

If
$$k > 2$$
, $\frac{v_{n+1}}{v_n} \xrightarrow[n \to +\infty]{} 0 < 1$ so $\sum v_n$ converges according to the d'Alembert's rule.

If
$$k < 2$$
, $\frac{v_{n+1}}{v_n} \xrightarrow[n \to +\infty]{} +\infty$ so $\sum v_n$ diverges according to the d'Alembert's rule.

3. Let
$$(w_n) = \left(\left(\frac{n}{n+a} \right)^{n^2} \right)$$
.

$$\sqrt[n]{w_n} = \left(\frac{n}{n+a}\right)^n = e^{-n\ln(1+a/n)} = e^{-n(a/n+o(1/n))} = e^{-a+o(1)} \xrightarrow[n \to +\infty]{} e^{-a}.$$

If $e^{-a} < 1$ i.e. a > 0, $\sum w_n$ converges according to the Cauchy's rule.

If $e^{-a} > 1$ i.e. a < 0, $\sum w_n$ diverges according to the Cauchy's rule.

If $e^{-a} = 1$ i.e. a = 0, then $(w_n) = (1)$ which does no tend to 0 so $\sum w_n$ is divergent.

Exercise 2 (4 points)

Via the transformations $C_1 \leftarrow C_1 + C_2 + C_3$ then $L_2 \leftarrow L_2 - L_1$ and $L_3 \leftarrow L_3 - L_1$, we find that $P_A(X) = (3 - X)(X + 1)(X + 3)$.

So P_A is split in \mathbb{R} and $\operatorname{Sp}_{\mathbb{R}}(A) = \{3, -1, -3\}$ with m(3) = m(-1) = m(-3) = 1. Thus, A is diagonalizable.

$$E_3 = \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \begin{vmatrix} -3x + 3y = 0 \\ x - 5y + 4z = 0 \\ x + y - 2z = 0 \end{vmatrix} \right\}$$

$$= \operatorname{Span}\left\{ \begin{pmatrix} 1\\1\\1 \end{pmatrix} \right\}$$

$$E_{-1} = \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \middle| \begin{array}{c} x + 3y = 0 \\ x - y + 4z = 0 \\ x + y + 2z = 0 \end{array} \right\}$$

$$= \operatorname{Span}\left\{ \left(\begin{array}{c} -3\\1\\1 \end{array} \right) \right\}$$

$$E_{-3} = \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \middle| \begin{array}{l} 3x + 3y = 0 \\ x + y + 4z = 0 \end{array} \right\}$$
$$= \operatorname{Span} \left\{ \begin{pmatrix} 1 \\ -1 \\ 0 \end{pmatrix} \right\}$$

So we have
$$D = P^{-1}AP$$
 with $D = \begin{pmatrix} 3 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & -3 \end{pmatrix}$ and $P = \begin{pmatrix} 1 & -3 & 1 \\ 1 & 1 & -1 \\ 1 & 1 & 0 \end{pmatrix}$.

Via the transformations $C_1 \leftarrow C_1 - C_2$ and $L_2 \leftarrow L_2 + L_1$, we find that $P_B(X) = (1 - X)(X + 1)^2$. So P_B is split in \mathbb{R} and $\operatorname{Sp}_{\mathbb{R}}(B) = \{1, -1\}$ with m(-1) = 2 and m(1) = 1. m(1) = 1 so $\dim(E_1) = 1$.

$$E_{-1} = \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \middle| \begin{array}{l} x - y = 0 \\ x + 3y - 4z = 0 \\ x + y - 2z = 0 \end{array} \right\}$$
$$= \operatorname{Span} \left\{ \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} \right\}$$

 $\dim(E_{-1}) = 1 \neq 2 = m(-1)$. Therefore, B is not diagonalizable.

Exercise 3 (4 points)

Via the transformations $C_1 \leftarrow C_1 + C_2 + C_3$ then $L_2 \leftarrow L_2 - L_1$ and $L_3 \leftarrow L_3 - L_1$, we find that $P_A(X) = -(X+1)(X+2)^2$.

So P_A is split in \mathbb{R} and $\operatorname{Sp}_{\mathbb{R}}(A) = \{-1, -2\}$ with m(-2) = 2 and m(-1) = 1.

Thus, A is diagonalizable iff $\dim(E_{-2}) = 2$.

$$E_{-2} = \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \middle| \begin{array}{l} -x + y = 0 \\ (a - 3)x + 2y + (1 - a)z = 0 \end{array} \right\}$$
$$= \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \in \mathbb{R}^3 \text{ such that } \middle| \begin{array}{l} x = y \\ (a - 1)x = (a - 1)z \end{array} \right\}$$

If
$$a = 1$$
, $E_{-2} = \operatorname{Span} \left\{ \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} \right\}$ and A is diagonalizable.

If
$$a \neq 1$$
, $E_{-2} = \operatorname{Span} \left\{ \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} \right\}$ and A is not diagonalizable.

Exercise 4 (4 points)

1. a. We have f(1) = 3X; $f(X) = 2X^2 + 1$; $f(X^2) = X^3 + 2X$ et $f(X^3) = 3X^2$, which leads to

$$\operatorname{Mat}_{\mathscr{B}}(f) = \left(\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 3 & 0 & 2 & 0 \\ 0 & 2 & 0 & 3 \\ 0 & 0 & 1 & 0 \end{array}\right)$$

ЕРІТА

b. The determinant of this matrix is equal to 9. Thus, it is invertible and the map f is bijective.

$$2. \ f(E_{11}) = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} - \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} 0 & -b \\ c & 0 \end{pmatrix} = -bE_{12} + cE_{21}.$$

$$f(E_{12}) = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} - \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} -c & a - d \\ 0 & c \end{pmatrix} = -cE_{11} + (a - d)E_{12} + cE_{22}.$$

$$f(E_{21}) = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} - \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} b & 0 \\ d - a & -b \end{pmatrix} = bE_{11} + (d - a)E_{21} - bE_{22}.$$

$$f(E_{22}) = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} - \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} 0 & b \\ -c & 0 \end{pmatrix} = bE_{12} - cE_{21}.$$

This leads to

$$\operatorname{Mat}_{\mathscr{B}}(f) = \begin{pmatrix} 0 & -c & b & 0 \\ -b & a - d & 0 & b \\ c & 0 & d - a & -c \\ 0 & c & -b & 0 \end{pmatrix}$$

Exercise 5 (4 points)

We find immediately that $P_A(X) = (1 - X)(2 - X)^3$.

 P_A is split in \mathbb{R} and $\operatorname{Sp}_{\mathbb{R}}(A) = \{1, 2\}$ with m(2) = 3 and m(1) = 1.

Thus, A is diagonalizable iff the dimension of E_2 is 3.

$$E_{2} = \left\{ \begin{pmatrix} x \\ y \\ z \\ t \end{pmatrix} \in \mathbb{R}^{4} \text{ such that } \middle| \begin{array}{c} -x + ay + bz + ct = 0 \\ dz + et = 0 \\ ft = 0 \end{array} \right\}$$

- If $f \neq 0$, we have t = 0, then dz = 0.
 - If $d \neq 0$, then z = 0 and x = ay. So $E_2 = \operatorname{Span} \left\{ \begin{pmatrix} a \\ 1 \\ 0 \\ 0 \end{pmatrix} \right\}$ and A is not diagonalizable.
 - If d = 0, then x = ay + bz. So $E_2 = \operatorname{Span} \left\{ \begin{pmatrix} a \\ 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} b \\ 0 \\ 1 \\ 0 \end{pmatrix} \right\}$ and A is not diagonalizable.
- If f = 0, then dz + et = 0.
 - If e = 0, then dz = 0
 - If d = 0, we have x = ay + bz + ct. So $E_2 = \operatorname{Span} \left\{ \begin{pmatrix} a \\ 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} b \\ 0 \\ 1 \\ 0 \end{pmatrix}, \begin{pmatrix} c \\ 0 \\ 0 \\ 1 \end{pmatrix} \right\}$ and A is diagonalizable.
 - If $d \neq 0$, then z = 0 and x = ay + ct. We find $E_2 = \operatorname{Span} \left\{ \begin{pmatrix} a \\ 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} c \\ 0 \\ 0 \\ 1 \end{pmatrix} \right\}$ and A is not diagonalizable.

• If
$$e \neq 0$$
, then $t = -\frac{d}{e}z$ and $x = ay + \left(b - \frac{cd}{e}\right)z$. So $E_2 = \operatorname{Span}\left\{\begin{pmatrix} a \\ 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} b - cd/e \\ 0 \\ 1 \\ -d/e \end{pmatrix}\right\}$ and A is not

diagonalizable.

Conclusion : A is diagonalizable iff d = e = f = 0.
